PREFACE

Many commonwealth states still ignore the usefulness of having a strong private security operations presence in their territory. As their reliance on state armed forces and a few unskilled security officers, to protect state assets and business interests in a time where transnational crime within commonwealth states are ever increasing.

Along with their limited amount of funding and dependency on other international organizations funding, their training programs, which are not useful to the type of threats facing them; delineates the issues further.

This topic theme is written to give these commonwealth states an awareness of their position now and how this can be improve for the future. As a nations economy relies heavily on a state security structure both in relation to protection of private business and sate business.

These types of operations would be an improvement to all former security type structures.

INTRODUCTION

The principals code name: dog is the type of eBook which examines the usefulness of having a private security operations created to function as one kind of asset which can improve the growth curve of a commonwealth state.

Known to all globalized populist; that commonwealth state possess limited resources to both sustain for its citizens and to be a trading partner to its regional and international counterparts.

Seeing this, it is solely on improving investor relations in creating new emerging markets within the commonwealth, which can broaden the supply curve and lessen the dependency curve from other member states.

These hopeful political ideologies distribute their economy to fit the new trading system globally. Private security entities must be developed to meet all new threats emerging out of a developing nation. Threats, which can hamper growth and increase cyclical costs of criminality surrounding the existence commonwealth state.

As transition may be difficult to transcend due to their vulnerable nature to detach themselves from the black trading market, these types of security operations are designed to eliminate threats theatre of all kinds.

Explained in the following topics, the reader will get a level of appreciation to the necessity of having their operations in a commonwealth state, as this is one of the most fundamental approach towards a high index investor system, for only few states have ever achieved their pinnacle status in the growth market.

**FOUR TYPES OF PRIVATE SECURITY
OPERATIONS NEEDED IN ALL
COMMONWEALTH ECONOMIC STATES**

SECURITY OPERATIONS TYPE **1**-

THE UNDERDOG OPERATIONS

THE MACQ TECHNIQUE FOR THE FIELD OPERATOR

The underground operational techniques are designed to entrust to the field operator, skillets necessary to survive their already security operations, in states which are hostile and require an adoptive skills which are more mathematical in designed.

The Mathematical Algorithmic Close Quadrant Technique (MACQ) is one such technique examined in this type of operation.

The MACQ technique encourages mathematic technical behaviors within all close quadrant space occupied by an operator during their operation.

Occupied space found within mobility or immobility for a considerable length of time is considered to be mathematical in design.

Operative words here is *mathematical-algorithmic* meaning their basis metrics and knowledge of math and reformatting its results into controlling space occupied, formulate it as a rhythmic every session technique to allow approaches to be more methodical.

There is no single multifactor use of best metrics approach as familiarity with basis math used locally can enhance the additional survival tactics, a corporate institution may or may not instill in training.

As an assurance its application of applying accuracy in the area of control, ensuring knowledge on every aspect of the space under direct protection.

Be familiar with the architectural measurements of the design of the space occupied direct to protection by having access to its blueprint; if not available there are security standards for designing building for protection, get access to such information and test its applicability with the best type structural design at the existing premise.

Having knowledge on all structural space and its limitation; as occupied space can be compromise and to what extent shall the operator enforce protection measures to control their own quadrant space.

The operator force must be greater than the perimeter force protection at every quadrant space within their space to protect, no matter its fortification mantle.

The MACQ technique quite simple indeed is just a reflection of space protected must not exceed space occupied by the operator.

The operator must know their strength application and their weakness too and possess the inside knowledge of their territory to enter into a space where their weakness can be enhanced where threats are imminent.

For not all occupied space are designed architecturally for the purpose of security in mind. Its afterthought application of including contract operator, to be the protector of its corporate assets may not possess the space for the operator to possess a controlled space quadrant, to survive any threats which target the protector more so than the structure.

Incumbent for the operator to not be a target but to apply the MACQ technique, along with additional self defense techniques and tools necessary for the operations of a specific duty.

The purpose of a underdog is to be ruthless where danger are incumbent, to appreciate the field of security and to prevent being a statistic, to perform the duty professionally and with

both foresight and hindsight in mind, in relation to counter-repetitive actions liable for the performance of duties.

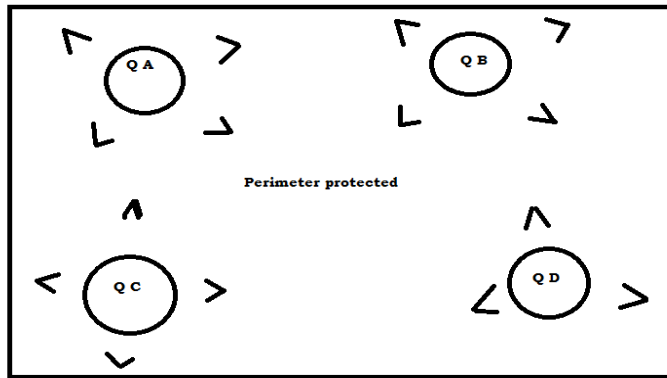

The MACQ technique becomes the new metrics for operation by the operator once knowledge of a situation assessment is conducted.

Situational assessments are using metrics to address how the operator presence can incur or defer the level of threats within the operation of their duty.

Many formats within the industrial security known and used are incremental in understanding the vulnerabilities of a territory about to be occupied.

Application of the assessment encourages a situational awareness presence of its territory and further evolves into a situational awareness behavior, necessary for the operator to adopt comfortably within their occupied territory.

Hence the MACQ is one such situational awareness behavior an operator can use as a tool to enhance their operation to be more mathematical in understanding their territory and its application to their own continual survival at the location.

A design showing how the operator tests the perimeter defense capability by creating suggestive threats scenarios, once being occupied at different space area on the perimeter being protected.

It examines their mathematical approach within their space and if the presence of threats arises, how the operator can have access to structural defense mechanism or be able to control their quadrant at the point of attack.

MACQ technical

1. Know your space occupied distance by establishing your own distance of threat one can deter and also to protect with their life.

2. Know your territory occupied and be alert to every type of localize changes to the territory whilst on duty and on entry towards a territory.

3. Know your strength capabilities and what the necessary weaknesses which need to be enhanced are.

4. Client to client relations is not client to operator relations. For the former, is a business solutions agreement and the latter are property protection agreement.

Having knowledge of this implies that the operator propose is to protect assets regardless of the position the operator undertakes so as such no harm is done to self or property.

5. Know your limitations; observe all situations to be threatal. Your level of threats must be determined quickly and its approaches to its minimization must be enhanced quickly.

6. Security is teamwork; no matter your skills level remember “space occupied is not always space protected.”

7. The security profession is about personal growth, having knowledge to the latest security information; local and

foreign security related news is essential in determining threats levels at your location being occupied.

As such developing your own situational awareness program for the territory enhances your chances of survivability.

8. There exists many security frameworks, technical's and tools which can aid an operator from being inoperable. Having knowledge about them are necessary and you must use them proficiently and professionally with or without the approval of your security commanders.

9. Security survival begins with you the field operator!

10. Keep all essential documents private and confidential on territories observed and assessed.

SECURITY OPERATION TYPE **2**-

THE SECURITY DOG

OPERATIONANL DESIGN AND MANAGEMENT
OF A PARAMILITARY SECURITY GROUP

In most commonwealth states security structure depicts a paramilitary structure. Based on their jurisdictional principles and national state laws, their structure are not prohibited but encouraged.

Guided by their institutional policies and legislative frameworks, these entities provide services to the business platform clients.

As seen in most commonwealth states, crime represents the biggest threats to local business operating in their state. As such, the formulation of these structures represents a balance between military and quasi organizational structures.

Crimes emanates a great desire to disturb the local economy and at sometimes look for aid to diminish their outlook as harmful, while gaining acceptance in the local business chambers.

Shadow businesses intertwined with international criminal bodies and corporate organizations forces most corporate local business to design a formidable taskforce needed for the times of protection in case need be.

As the survival rate of corporate leaders are tested daily in states with criticality of failure operational mode increases dramatically to geo-social issues, these paramilitary groups are the protection of many threats theatres.

Paramilitary security functions on one principle of enforcing all existing taught survival method on the one principal approach of ensuring business continuity remain at a high confidence level always.

Their level of confidence is determined by their level of confidentiality in dealing with security threats below the radar of a commonwealth state laws or policies.

Hence their operability can be recognized as a militia group performing more of a asymmetrical style of operation than a conventional type security operation body does.

However true this may be, its operation are only designed in lieu of the type of corporate structures and investments placed in protecting a asset necessary in building the local economy of the commonwealth state.

Its further dependency may allow a more grandeur outlook operation in ensuring all continuity remains undisturbed regardless if the threats become immobilized.

Operational management and operability designs remain imperative to the territory it operates under. As commonwealth states possess difficulty in obtaining rich resources to further increase the valuation of its economy, it increases the awareness of the para-security-militia group, to be more alert in not only protecting the interests of its employers but also the sustainability of its client end product called them the citizens.

All said above represents a private security company operating as a paramilitary group, guided by the authority of a legislative framework, to ensure these groups do not become a hostile opponent in the near future.

It is becoming of a territory to determine the faith of a paramilitary security group existence in a state already faced with economical challenges to have a sustainable operating armed force.

Paramilitary security agencies are an essential operation in economically strained economies, as its focus on protection

of an economical asset class in a division falling far from the responsibility of the armed force.

Regardless if their operations are not supported by state laws or function on total remit of their corporate head. Transnational threat theatres found globally has no boundaries and find illusive ways to make profitable bodies to be a target, removing all thought of the detrimental costs on commonwealth state's economy.

The surface view of a paramilitary security group only shows its forceful tactical design to be an evasive force one cannot reckon with.

Its' necessary outlook deters threats from occurring as it is a corporate expensive operational cost to increase productivity and maximize in decreasing economical costs at all venture.

Protection of all assets, brands and its workforce are all representation of its business structure.

Prohibiting its use is a cause to be concern from an operational throughput, as its only design is to do what it was created to do; to be the operational threat all incoming

theater will fear, if their desire is to be a disruptor to business operability.

Paramilitary Security Group technical

1. A paramilitary group is a necessary security operation for today global threats.
2. A paramilitary security group must be designed into a business model and be controlled internally if state laws are placed to control its existence.
3. A paramilitary security group must be designed to complement the territory it covers and be a shadow operation within the territory it operates.
3. Some commonwealth states defer the title of paramilitary and may encourage the use of a softer business model approach, hence all lawful policies must be adhere to, however its operational culture and training must be able to match the threats level of the territory, in protecting multinational corporations and its assets.
5. Some commonwealth sates my not possess the atypical training to aid in their own internal security issues, as such, any newly established security entity which force output is

greater than the local security forces, their liaison committees must be established in bilateral agreements and inter-security diplomatic relations policies established to assist the local but to protect the paramilitary security group from corporate and international litigations.

6. Note that some existing private security operations possess paramilitary security culture but their operations are not; as they are guided by state laws and policies.

Any business mergers where the major stakeholder demands a paramilitary security group to be emanated in the company's business framework, then the culture may be operationalized having done proper communiqués to all legal departments and entities governing its existing on the state.

For the use of such entity may be an undiplomatic use of their force, however when threats are imminent on the corporate business and their operation are above reproach from criminal actions in relation to state laws and other exigency agencies.

SECURITY OPERATIONS TYPE 3-

THE CORPORATE DOG

VALUE MANAGEMENT-

STRENGTHENING THE CORPORATE SECURITY INDUSTRY

The emphasis of this type of security operations is to promote a monolithic security corporation to be the most dominant power in a commonwealth state.

From both a business and national perspective to a state, it is necessary that a one bodied powerful private security entity, be the hegemonic power to establish and maintain good business relation to improve the security industry.

For at times, many commonwealth states ignore the essential purpose of building a national security framework, both private and public security operators in mind.

Placing all security disposal to the state uniform institutions, as the only hegemonic power to protect both the business and civil community.

This type of maneuverability of control is the mechanization of public security and public disaster towards the future economics of a country.

As both security entities functionality are different, serving different operations and their reliance on economic value bear little allegiance to the time essence of what a business entity sole reliance is on, in relation to interfering with

corporate ethical relations, is a financial disaster wanting to be discovered.

The corporate dog on seeing issues emanating similar to the state security takeover, must be a lobbyist to removing state involvement in corporate security, as this type of operation shall be an external influence in national security issue platform and associated groups.

On reliance to the state to provide additional security to the corporate entities shall be on a written policy mandating their use can be superficial to the company growth; however as a company security support network good publicity is utilized.

Hence the importance for the domination of its sector, as the corporate security world is improving daily and its sector which can be recognized as the most advanced area in the profession must market this product efficiently, on the importance of its close relation to investor confidence and interests on returns by co-operation contracts.

Keeping in mind that the essential total operation of private security operators operating undisturbed in their territory,

creates greater multinational interests to investors entering into the emerging market of the commonwealth.

As a supporting factor it is also a business entity providing security solutions for their clients. Business to business relations done within a harmonious network encourages the growth curve of the local market to be on par to supplier relations and purchasing power of its international dependents.

The corporate dog strategy is to be the dog in the industry, competing towards the state apparatus and other security operators to be on par towards improvements of the security economics of the state.

Introducing stern and punitive solutions to public administrators and corporate associations when failure mode increases and productivity decreases.

Rationalizing their deficiency on the international market until their tolerance level decreases due to innovative drive, set forth by the one entity security provider to reverse the market and be the supplier to their existing clienteles.

The survival game in business is to possess powerful players in the private security operations business and to defer from entering in this game; unless willing to sacrifice cultural indulgences for total economical domination.

The mission is to control all addressable market and to find innovative means in ensuring a balance exists between corporate statutes and state statutes, dealing with public opinion and their criticism of their means to control.

The Corporate Dog technical

1. Enter the security market with the intention to control the total addressable market, to become the hegemonic power in ensuring balance between the state and the corporate investor.
2. Encourage lobbying for improvements of the security industry by enforcing stringent investor policies which can aid the growth curve of the state.
3. Merge and conquer many small security firms, competitive to the framework set by being the powerful player in the industry.

4. Communicate framework to commerce chamber, business community, public administrators and legislators and international investors on improving confidence level and investor index in the state being occupied.
5. Acquire enough financial resources and a sophisticate research department to amass the strength of the consulting aspect of the business model.
6. Keep abreast with the territorial changes of the local economy, in terms of national resources capacity, investor index charts, transnational threat level and geopolitical intra-conflicts.

SECURITY OPERATIONS TYPE 4-

THE BULL DOG OPERATIONS

MILITARY AND DEFENSE CONTRACTORS-
RE-ENGINEERING CORPORATE SECURITY PROTECTION
FOR BOTH SERVICE AND SOLUTION PROVIDERS

It is desirable that a growing commonwealth state economy reaching suitable growth level and increasing their international partnership community possess, aforethought to acquire professionally trained entities outside the scope of the regulated armed forces industries.

These unregulated entities functions outside the bandwidth of allegiances to a state and focus on attention driven by threat theaters syndicates, designed to interrupt the continuation of a state growth.

Its purview operations of seasoned veterans in territorial conflicts and amongst war machine moguls, who seek rewards for creating conflicts within vulnerable states.

Operators in both the services and solutions security industry; these military and defense contractors, serves a unique purpose in adding additional operators in the nation's defense.

It is about having all types of operations at a states disposal especially where commonwealth states suffers from constant economic disruptors, plagued by a society ill will to become economically driven citizens and encourages the

underground networks; as its fruition are wealthier than the state reward mechanisms.

A force greater than their competitors, would surely demise the underground networks, forcing their operators to be dismal, for most part obsolete.

As these operations infiltrate the society belligerence and inequality status financially and operationally, targeting both types of methods will have to be replaced, when mobility occurs.

As the needy and the dependent citizen seeks new or former alternative to reenter into the market. The reward system would need to be planned as the state grows out of systematic dependency form the black trading market.

Defense contractors with their upscale solutions aid in economic treaty in providing their technology in partnership, in encouraging investor relations program at the expense of the state usage of their products.

Ground experts further purge the society and protects other interests groups in ensuring that the state property is functional to address all external threats advocate positions.

The territorial goal is to have all committee members, business community and state leaders to have an understanding on the necessity of having these types of security operations home front.

Additionally, it is the rights of an international community operating domestically to seek the interests of their corporate seal, to invest in security operators suited to protect their business from both domestic and foreign terror-criminals networks.

Even so, if the commonwealth state refers to their security article in pressuring foreign nationals privilege, to operate covertly in a nations soil as a act of foreign influence acting on their will to control a state economic future and political agendas.

Non evasive this topic is for both entities must have a futuristic goal set in determining the factors which can aid a nation to rise and those which can infer conflict and disaster on the other end.

Debating on their use profusely, can inept the situations and have all operators disillusioned on their functionality to operate on behalf of their employees, clients or state.

Interests' parties with different agendas corruptly cause more state assets to be vulnerable and state relations to be dismal.

The solution is about re-engineering security protection to fit all types of global threats facing any growing economy first and secondly, to take pride of the achievement when threats are eliminated.

No other thought should be geared in international diplomatic relations and inflicting power reign onto a weaker state. As commonwealth states seeks new emerging markets to become new entrants in the world economy.

The Bull Dog Security technical

1. Know that these types of operations can be accessible to either a state or a corporation business operating in a commonwealth state. Their usage of it is determined on the threat levels the state position is in.
2. Off the books operations in securing the total mental wellness from a leadership point of view can be looked as a stoic act to commit. However these actions are not

reprehensive when a state economy stands between enemies of the state and citizens standard of living increasing.

The latter point of view resonates as the people deserve more than just their will power to obtain sustenance from other economies as a dependency.

3. Economic wellness works as a precursor to its aid *security wellness*. Both are seemingly inseparable to each other as threats facing an economic state are met by a security force insurmountably greater than the oppressing force.

The aggressor force must never be greater than the state apparatus. Knowledge of all types of security operators would decrease susceptibility to criticality.

4. Defense and military contractors are economic tools proven to increase safety, security and economic growth; regardless who their clients are they are a model proven to give greater return on investment.

TOPIC END

Private security operations of all types continue to play an important role in protection of corporation business continuity and also state assets if deployed.

As many detractors vehemently speak against their operations and the powerful allegiance they have for large multinational corporations, looked as their private army, they serve an important function to encourage more investors and international parties to be confident in doing business in an already strained and infertile state.

Without their existence, the corporate world would think twice in investing in a developing state, where security systems is not operative enough to protect interests groups.
